## Refresh On Load option

---

### **Abstract**

Refresh On Load is presented as an option in certain Data Connections, as well as the Connection Refresh Button component. This whitepaper will detail the functional differences when the option is enabled in a Data Connection versus when it is enabled in the Connection Refresh Button. The following is applicable with the SP1 release of Xcelsius Engage 2008, Xcelsius Engage Server 2008 and BusinessObjects Xcelsius Enterprise 2008. By reading this whitepaper you will gain understanding of the functionality of the Refresh On Load option in both a Data Connection and the Connection Refresh Button component, as well as uses for the option in both instances.

## Introduction

In the initial release of Xcelsius 2008, Refresh On Load was an option available only in certain data connections: Query as a Web Service, Web Service Connection, and XML Data. With the release of Xcelsius 2008 SP1, the Refresh On Load option was added to the Connection Refresh Button component. Although the option has the same basic function in each instance, it does operate differently. The addition of this option to the Connection Refresh Button enables users to mirror a functionality that is present in Crystal Xcelsius Designer 4.5. Below we will explore the functionality of Refresh On Load in a Data Connection, then in the Connection Refresh Button component. Lastly, we will present use cases for the two applications of Refresh On Load.

## Functionality in a Data Connection

In this section we will cover how to enable the Refresh On Load option in a Data Connection, then how the option functions in the SWF file.

### Enable Refresh On Load

The following steps enable the Refresh On Load option in a sample Data Connection.

1. Launch Xcelsius 2008.
2. Open the Data Manager (from the main menu go to Data > Connections...).
3. Click Add.
4. Select XML Data.
5. Click the Usage tab.
6. Under Refresh Options, check the box next to Refresh On Load.

## Function in SWF file

When the SWF file is launched, data is retrieved from the spreadsheet and any data connections, and then dashboard components are generated. Data that is retrieved, just prior to the components' generation, is used by the components' as default data set.

The Refresh On Load option forces the Data Connection to retrieve data from the source before the components are generated. Therefore, the components will use the data retrieved by the Data Connection upon load as the default data set.

In Crystal Xcelsius 4.5, this functionality would have been observed when enabling the Use Web Service option, under File > Export Settings.

## Functionality in the Connection Refresh Button

In this section we will cover how to enable the Refresh On Load option in Connection Refresh Button component, then how the option functions in the SWF file.

### Enable Refresh On Load

The following steps enable the Refresh On Load option in the Connection Refresh Button component.

1. Launch Xcelsius 2008.
2. On the Components browser, under the Categories tab, click Web Connectivity.
3. Click Connection Refresh Button and drag it to the Canvas.
4. On the Properties Panel, click the Behavior tab.
5. On the Common tab, under Trigger Behavior, check the box next to Refresh On Load.

## Function in SWF file

When the SWF file is launched, data is retrieved from the spreadsheet and any data connections, and then dashboard components are generated. Data that is retrieved, just prior to the components' generation, is used by the components' as default data set.

As a component, the Connection Refresh Button must be generated before its selected options can be acted upon. The Refresh On Load option forces the Connection Refresh Button component to retrieve data from the source using its associated data connection, after the component is generated. Therefore, the data retrieved by the Connection Refresh Button upon load is not used as the default data set.

In Crystal Xcelsius 4.5, this functionality would have been observed when enabling certain Web Connectivity button components' Refresh On Load option, on the Behavior tab.

## Use Cases

In this section we will discuss the benefits of enabling the Refresh On Load option in a Data Connection, the Connection Refresh Button component, and simultaneously in both.

## Use in a Data Connection

Data is retrieved before the components are displayed, avoiding a screen flicker when changing from spreadsheet data to connection data.

The data retrieved on load by a Data Connection is included as part of the default state of the model, providing the data set for bound component features like initial limits and the Reset Button.

## Use in the Connection Refresh Button

Data is retrieved after the components are displayed. This may be perceived as faster initialization, because the loading bar may be displayed for a shorter period of time.

Data is retrieved after the selector components insert their data, thereby allowing components to provide parameters necessary for the data connection associated with the Connection Refresh Button.

The data retrieved on load by the Connection Refresh Button is not included as part of the default state of the model, therefore there is no data set for bound component features like initial limits and the Reset Button.

## Use in both a Data Connection and the Connection Refresh Button

This usage scenario is not recommended. The best practice would be to choose to enable the Refresh On Load option in only one, either in a Data Connection or in the Connection Refresh Button component. Enabling the option in both instances would retrieve the same data twice, creating excess network traffic and clutter within the application.
